

Isophthalic polyester resins

Glass reinforced plastic (GRP) has been used for various types of equipment in the chemical processing industry since the early 1950's. Its use has continued to grow in pulp and paper, power, waste treatment, semi-conductor, metals refining, petrochemical, pharmaceutical, engineering, food and drink processors and many other industries. Process vessels of all shapes and sizes, scrubbers, floor coatings, gratings and tank linings are just a few examples of products made from GRP.

The chief reason for the popularity of these materials is their excellent resistance to corrosion. When choosing the best material for construction, GRP is often chosen due to its:

- Corrosion resistance to a wide range of acids, chlorides and solvents
- Heat resistance
- Electrical and thermal insulation
- High strength to weight ratio
- Low maintenance, rust free equipment
- Ease of installation and repair

The chemicals used in the manufacture of fibreglass grating are constantly evaluated for peak performance. Fibreglass grating is made to strict ISO 9002 standards. All materials used in its manufacture are sourced from ISO9002 registered companies.

When requesting recommendations for corrosion resistant fibreglass grating, users or specifiers should be prepared to supply the following data:

- All chemicals to which the grating will be exposed
- Normal operating temperature, maximum and minimum

- Normal operating concentrations of chemicals including trace amounts
- pH range of the system
- Duration of normal and maximum operating temperatures

Liquid polyester resins are actually polymers dissolved in styrene monomer. The fabricator cures these resins to a solid state by reacting the polymer with the styrene in the presence of glass reinforcements to produce a glass reinforced rigid structure. The standards for these structures are defined by organizations such as ASTM and ASME.

The development and manufacture of resins has been a continuing process since 1954. They have been used to fabricate thousands of different types of corrosion resistant GRP equipment. Many different versions of resin have been developed for ease of handling during hand lay-up, filament winding, pultrusions, moulding and most other methods of commercial fabrication.

Isophthalic polyester resins are a broad class of products of raw isophthalic acid, glycols and maleic anhydride. The specific raw materials are selected to impart desired properties and corrosion resistance. The resins we use in our fibreglass grating will offer good corrosion resistance over a wide pH range.

The temperatures shown are not necessarily the maximum service temperature. It is the upper temperature at which the resin has been tested. It is possible a higher temperature could be obtained but additional testing would be required to establish such performance.
