M-501 standard coating solutions

Our guide to choosing compliant protective coatings for offshore structures.

NORSOK PPG systems guide

M-501 standard coating solutions

We have published this brochure to guide you through the selection of PPG products and systems that comply with the surface preparation and protective coating standard, as described in NORSOK M-501.

NORSOK standards were developed in 1994 by the Norwegian petroleum industry and today serve as a global reference for ensuring the safety, added value and cost effectiveness of protective coatings used within challenging offshore environments.

NORSOK M-501 outlines the requirements for the selection of coating materials, surface preparation, application procedures and the inspection for paints, metallic coatings and passive fire protection. The aim of this standard is to obtain a coating system that ensures:

- Optimum protection of the installation with minimum need for maintenance
- Use of products that are application and maintenance friendly
- Health, safety, and environmental impacts are evaluated and documented

The tables published within this brochure highlight examples of PPG's protective offering for coating systems that have been tested to and comply with the pre-qualification requirements established by NORSOK. Recommended systems that satisfy the defined exposure conditions are also included.

Please contact your local PPG Protective Coatings representative for further advice on coating recommendations.

NORSOK M-501 standard system classifications

Since NORSOK M-501 requires a surface preparation of Sa 2½, all coatings systems listed may be assumed to be Sa 2½ prepared. The latest versions of NORSOK (rev. 5 and 6) adopt ISO20340, where relevant, as the pre-qualification test standard for coating materials.

All recommended PPG systems have passed the rigorous laboratory testing described for each NORSOK system, where applicable.

Only pre-qualified systems require prior testing

System 1 (pre-qualified)	Carbon steel with maximum operating temperature < 120°C (248°F) <ul style="list-style-type: none"> • Structural steel • Exteriors of equipment, vessels, piping and valves (not insulated)
System 2	Carbon steel surfaces exposed to operating temperatures > 120°C (248°F)
System 3A-3G (System 3B pre-qualified)	Internal surface of carbon steel tanks
System 4 (pre-qualified)	Walkways, escape routes and lay down areas
System 5A (pre-qualified)	Epoxy-based fire protection
System 5B (pre-qualified)	Cement-based fire protection
System 6A	Uninsulated stainless steel when painting is required. Aluminum when painting is required
System 6B	Hot-dipped, galvanized steel when painting is required
System 6C	Insulated stainless steel piping and vessels at temperatures < 150°C (302°F)
System 7A (pre-qualified)	Carbon and stainless steel in the splash zone
System 7B (pre-qualified)	Submerged carbon and stainless steel ≤ 50°C (122°F)
System 7C (pre-qualified)	Submerged carbon and stainless steel > 50°C (122°F)
System 8	Structural carbon steel with maximum operating temperature ≤ 80°C (176°F) in internal and fully dry and ventilated areas
System 9	Bulk-supplied carbon steel valves with maximum operating temperature up to 150°C (302°F)
